FUTURES TRADING INDICATOR

THE GREEN LIGHT SPECIAL

The Complete Trading Course

"When it's green, you go."

● Trend ● Momentum ● Setup

TRADEGREENLIGHTSPECIAL.COM

WELCOME

Read this once, then keep it **beside your charts**

This course teaches you to use the **Green Light Special (GLS)** and its companion **GLS OSOB** the right way — read the dashboard, dial in the settings, take a trade step by step, manage it, and know when to stand aside.

HONESTY UP FRONT

GLS is a decision tool, not a money machine. No indicator predicts the market or guarantees profit. The edge is *filtering, risk/reward, and discipline* — this course teaches all three.

GLS in action — the banner calls "GO — TAKE IT" and the limit waits for the fill.

PART 1 — WHAT YOU GET

Two indicators, **used together**

1. **Green Light Special** — the main chart indicator. Reads direction across four timeframes, filters the chop, and shows you when to enter, where the stop and target go, and how big to size.
2. **GLS OSOB** — a companion pane below price. One job: tell you when to **get out / take profit**.

GLS tells you when to get **in**. OSOB tells you when to get **out**. Run both.

MES · S&P

MNQ · Nasdaq

MGC · Gold

MYM · Dow

Best on 5m & 15m

PART 2 — QUICK START (5 MIN)

Get it on the chart

1. TradingView → **Indicators** → **Invite-Only Scripts**.
2. Add **Green Light Special** and **GLS OSOB**.
3. GLS goes on the price chart; OSOB drops into its own pane below.
4. Use **MES / MNQ / MGC / MYM** on the **5m** (day trading) or **15m** (context).

ONE-TIME ONLY, IF NEEDED

If lines ever look detached from the candles, right-click the price axis → "**Merge all scales into one.**" The latest version locks to the candles automatically, so most people never touch this.

 Firewall

Recommended values

- **Chop filter:** 0.3 — lower = more signals, higher = stricter.
- **Volume × average:** 1.2 — only break on above-average volume.
- **Sniper band width (× ATR):** 1.0 — lower = more signals.
- **Max risk per trade (\$):** your number (\$100–\$250). GLS auto-sizes to it.
- **Reward (R):** 2.0–3.0. **Daily loss / goal:** match your account rules.

RULE

Start with the defaults. Change one setting at a time so you learn what each does.

Read this first, every time

The GLS dashboard — GO panel, the 3 green lights, the timeframe read.

Day · 4h · 15m · 5m, each ▲ UP or ▼ DOWN. All green = strong long, all red = strong short, mixed = wait. This is your bias — trade with it, never against it.

● The 3 green lights

① **Trend** (clean, not chop) · ② **Momentum** (not exhausted) · ③ **Setup** (a real entry is present). Plus live day P&L and win %.

The status banner

GET READY →

SYSTEM GO →

RIDE IT →

RUNNER →

DONE

THE BANNER IS THE FINAL WORD

Three green lights alone is **not** a green light. Wait for the banner to say **SYSTEM GO**.

PART 5 — THE SIGNALS

Green light. Red light.

-  **Green dot** = long ·  **Red dot** = short.
- **Small dot** = standard signal. **Large dot** =  **STRONG** (all four timeframes also agree) — your highest-conviction trade.
- Every dot is **with the trend**, on a **closed candle**, with **volume**, **in session**, **out of chop**. No random counter-trend signals.

When a signal fires, GLS draws the full **ticket**: entry ·  stop ·  target · size.

PART 6 — THE ZONES

Where the **action** happens

Golden pocket (sell zone) + ★ A1 + reversal zone + a limit waiting for fill, in a STRONG SHORT.

- ★ **Golden Pocket** — the 0.618–0.79 retracement, the prime pullback entry. Orients to your trend: leaning long → buy zone; leaning short → sell zone.

-  **Reversal Zones** — where price stalls and turns. Good for exits and spotting where a pullback ends.
-  **Strong S/R** (optional) — levels tested 2+ times that held.
-  **ORB** — the opening range; a volume-backed break in the trend direction.
-  **FVG** — a gap reads "wait for fill," then flips to "✅ FILLED — GET IN" when price tags it.
-  **VWAP** — institutional fair value; great for managing a runner.

A gap flips to "✅ FILLED — GET IN" right at the premium-sell line.

The golden pocket, broken down

The single best pullback entry in the whole tool. When price has moved, it rarely runs forever — it pulls back, then continues. The golden pocket tells you **exactly how deep that pullback should go** before you buy (or sell).

In an uptrend: measure the up-leg, wait for price to retrace into the 0.618–0.79 zone, then buy the bounce.

What the numbers mean

- GLS measures the last real swing leg (swing low → swing high).
- It draws the **0.618–0.79 retracement** as a gold band — the "golden pocket."
- That band is the **discount zone**: deep enough that weak hands are flushed, shallow enough that the trend is still intact.
- 0.5 is "equilibrium" (fair value). Above it = premium, below it = discount.

How to trade it

1. **Uptrend** → the pocket is a **BUY zone**. Wait for price to pull back into the gold band and confirm back up, then buy — stop just below the band.
2. **Downtrend** → the pocket flips to a **SELL zone** (it always matches your DIR lean). Sell the rally into the band.

3. It's strongest when the pocket lines up with VWAP or a strong S/R level — that's an A+ (★ A1) setup.

Live: the gold "sell zone" pocket in a STRONG SHORT, with the ★ A1 setup marked.

DON'T FORCE IT

A pocket tap alone isn't a trade. You still need the trend behind you and confirmation back through the zone. No confirmation → no entry. The pocket tells you *where* to watch, not *when* to blindly click.

PART 7 — THE YELLOW MAN

A warning — not a buy

A Yellow Man flip in a downtrend — a warning, not an entry.

The **Yellow Man** paints a candle yellow when short-term momentum flips. It means "heads up, something may be turning" — a caution light, not a green light. **Do not trade on yellow.** Yellow = get

ready; green light + GO = go.

CRITICAL

If the Yellow Man flips **against** your trend (a flip-up while leaning SHORT), it's usually just a **pullback / fake-out** — a place to look for a continuation in the trend direction, not a counter-trend entry. The system won't hand you a counter-trend trade, and that's correct.

Your exit tool — full breakdown

OSOB sits in its own pane below price. One job: tell you when to **GET OUT / take profit**. GLS gets you in; OSOB tells you when the move is running out of gas.

The OSOB pane — the wave, red tops, green bottoms, and the gold exit-bell dots.

The 3 reference lines

- Red dashed (~+40) = **OVERBOUGHT** — up-move stretched.
- Gray (0) = neutral midline.
- Green dashed (~-40) = **OVERSOLD** — down-move stretched.

The wave color

- White, drifting → momentum healthy → **let it ride**.
- Red top → a long is tired → first target / scale.
- Green bottom → a short is tired → cover / scale.

GOLD DOTS = THE EXIT BELL

The extreme is rolling over. **When the gold dots fire, act** — take profit, scale, or tighten your stop. Don't wait for the wave to crawl all the way back.

How to use it with GLS

1. GLS gets you in (● / ● light).
2. While in the trade, **white wave = hold**.
3. Wave hits the colored extreme + ● **gold dot fires** → **take profit / scale / tighten**.
4. Use OSOB alerts to get pinged on your phone.

HONEST RULE — READ TWICE

Overbought/oversold works in **ranges** and **fails in strong trends** (it pins at an extreme while price keeps running). Use OSOB for **EXITS and scaling only** — **never to enter, never to fade a trend**.

PART 9 — THE PLAYBOOK

One trade, **step by step**

1. **Read DIRECTION** — trade with the lean.
 2. **Wait for SYSTEM GO** — not just three lights, not a yellow candle.
 3. **Take the entry GLS draws** — entry, stop, target, size.
 4. **Breakeven at +1R.**
 5. **Let the trail ride** (banner: RUNNER — LET IT RIDE).
 6. **Exit with OSOB** — gold exit-bell → take profit / scale.
 7. **Stop at your daily goal or loss limit.**
-

PART 10 — RISK & THE FIREWALL

The real edge

- **Auto sizing** to your \$ risk · **ATR stop + R target** · **trailing** (BE at +1R).
 - **Daily Firewall** — loss cap + profit goal; hit either → **STAND DOWN**. This keeps funded accounts alive.
 - **News blackout** — blocks 8:30 & 10:00 ET by default.
-

PART 11 — WHEN NOT TO TRADE

Skipping is a skill

✗ CHOP (banner says stand aside) · ✗ against the trend · ✗ into a reversal zone with the trend exhausted · ✗ during news · ✗ after you hit your daily limit or goal.

Trade the opens

Markets: MES · MNQ · MGC · MYM. Trade the **opens** — London (~3:00 AM ET) and the NY open (index 9:30 ET, gold ~8:20 ET). Avoid the dead midday chop. 5m to trade, 15m for context.

Don't do these

1. Buying the yellow candle (it's a warning).
2. Trading against the DIR lean.
3. Entering into a reversal zone with the trend (that's a take-profit spot).
4. Ignoring the banner (three lights ≠ go).
5. Skipping the stop or oversizing.
6. Trading after STAND DOWN.

Turn on when **you're ready**

BEGINNER TIP

Ignore this page for your first couple weeks. Master direction → green light → manage → exit first. Come back when you want more tools.

Power features on a Dow chart: PDH/PDL + Midnight/Weekly Open levels, the ★ A1 setup, STRONG LONG.

- **BOS / CHoCH** — structure breaks (continuation vs reversal).
- **Pullback entries** — dip to the trend line, resume with the trend.

-  **Premium / Discount zones** — buy-low / sell-high shading.
-  **Liquidity lines** — PDH/PDL + PWH/PWL (where stops sit).
-   **HTF-confirmed Yellow Man** — a stronger flip when higher timeframes agree.
-   **Strong S/R** ·  **4h & 15m levels** ·  **Swing mode** ·  **Power Hour** ·  **News-day stand-down.**

FINAL WORD

Right side of the trend. Inside your risk.

GLS keeps you with the trend, out of the chop, and inside your risk. Be patient, wait for the green light, take the trade it draws, manage it, protect your daily number.

DISCLAIMER

Educational tools, not financial advice and not a signal-for-hire service. No indicator guarantees profits. Trading futures involves substantial risk of loss. Backtest and forward-test, trade small, manage risk. Past performance does not guarantee future results.
